# reg()

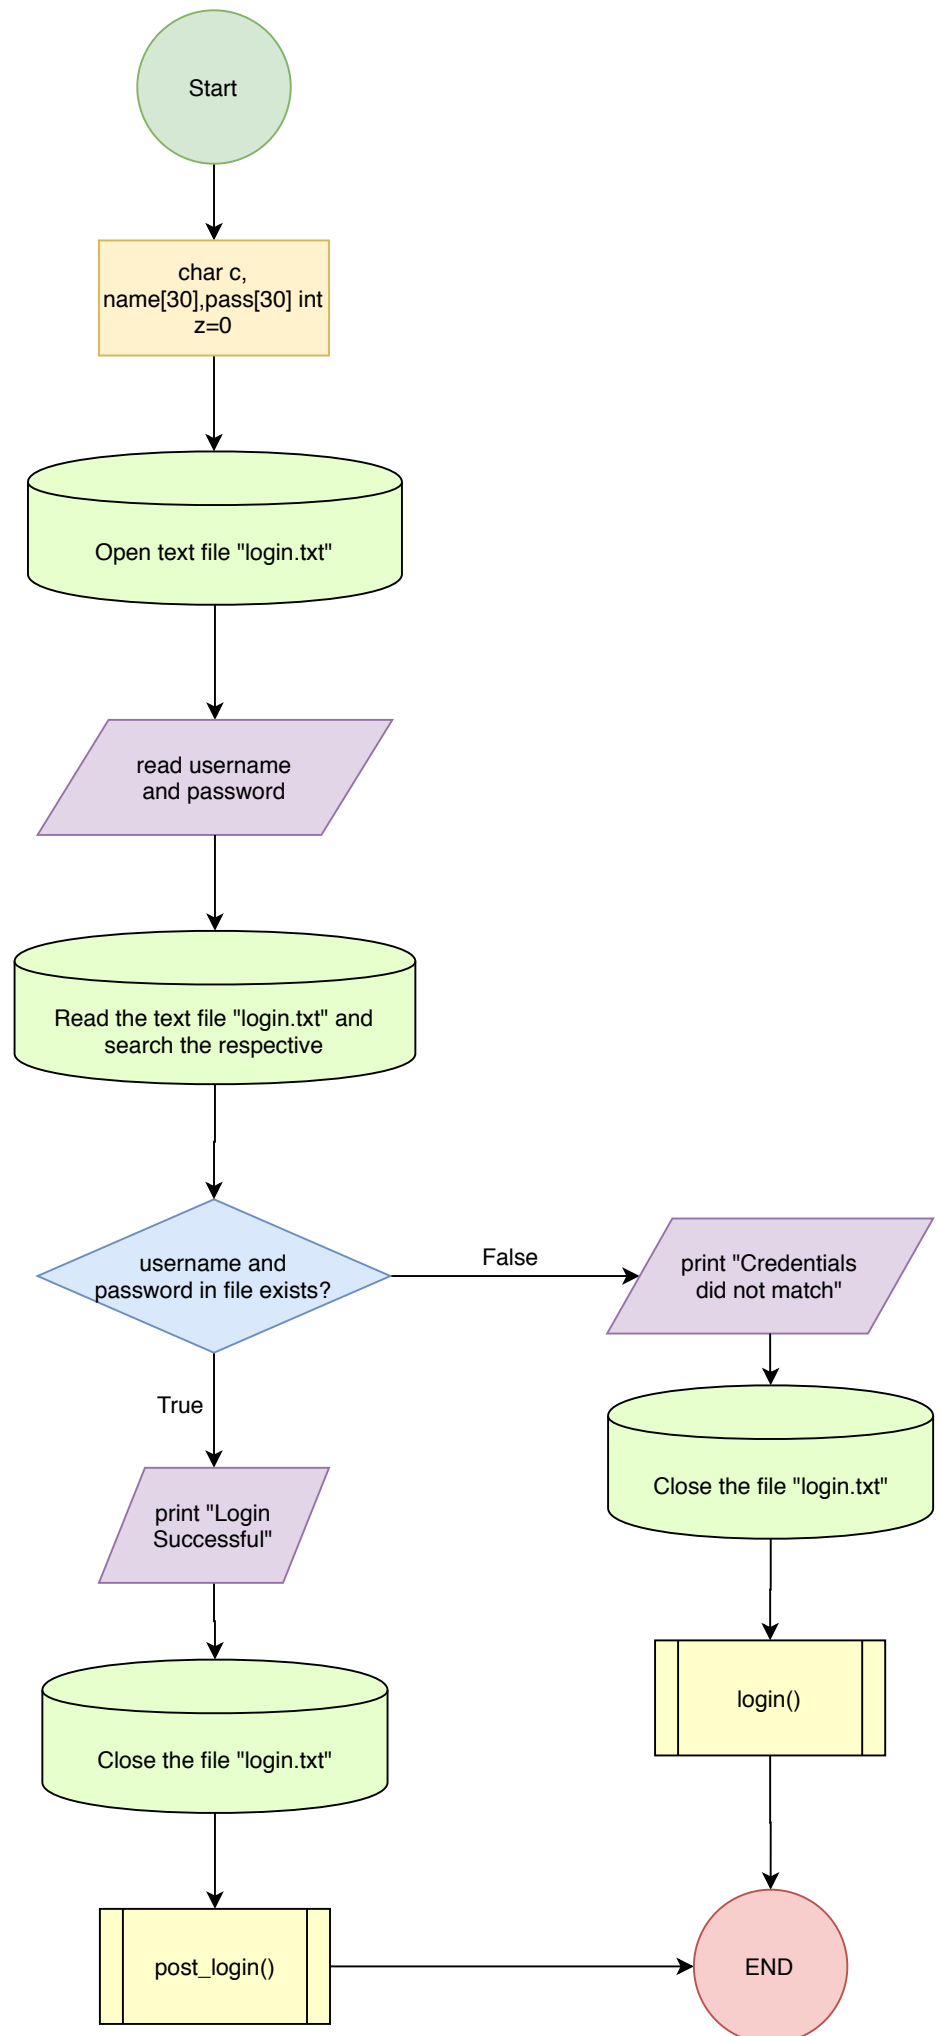

This function adds employers' details and makes a login ID for them.

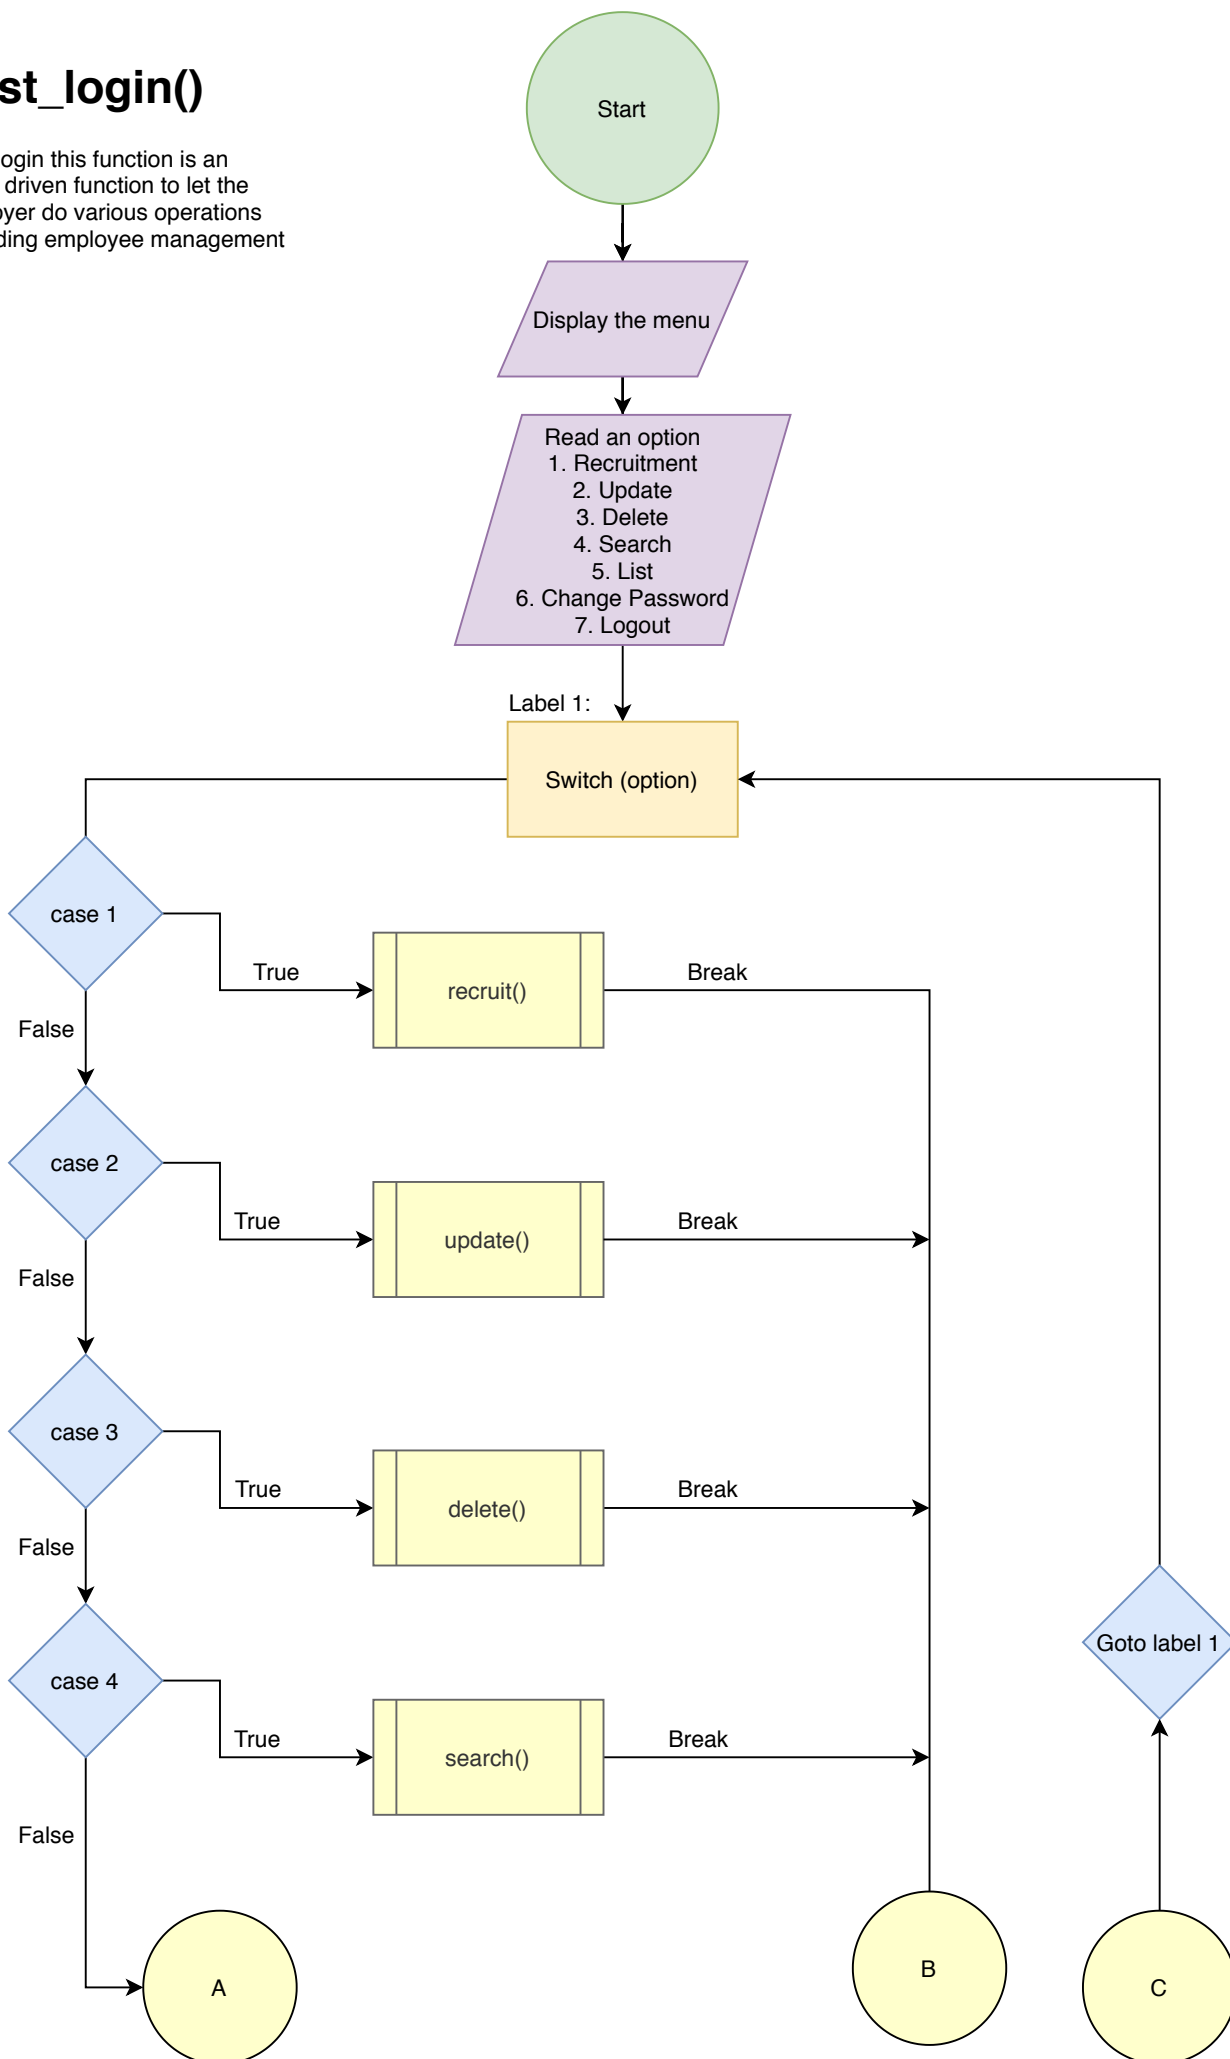

# login()

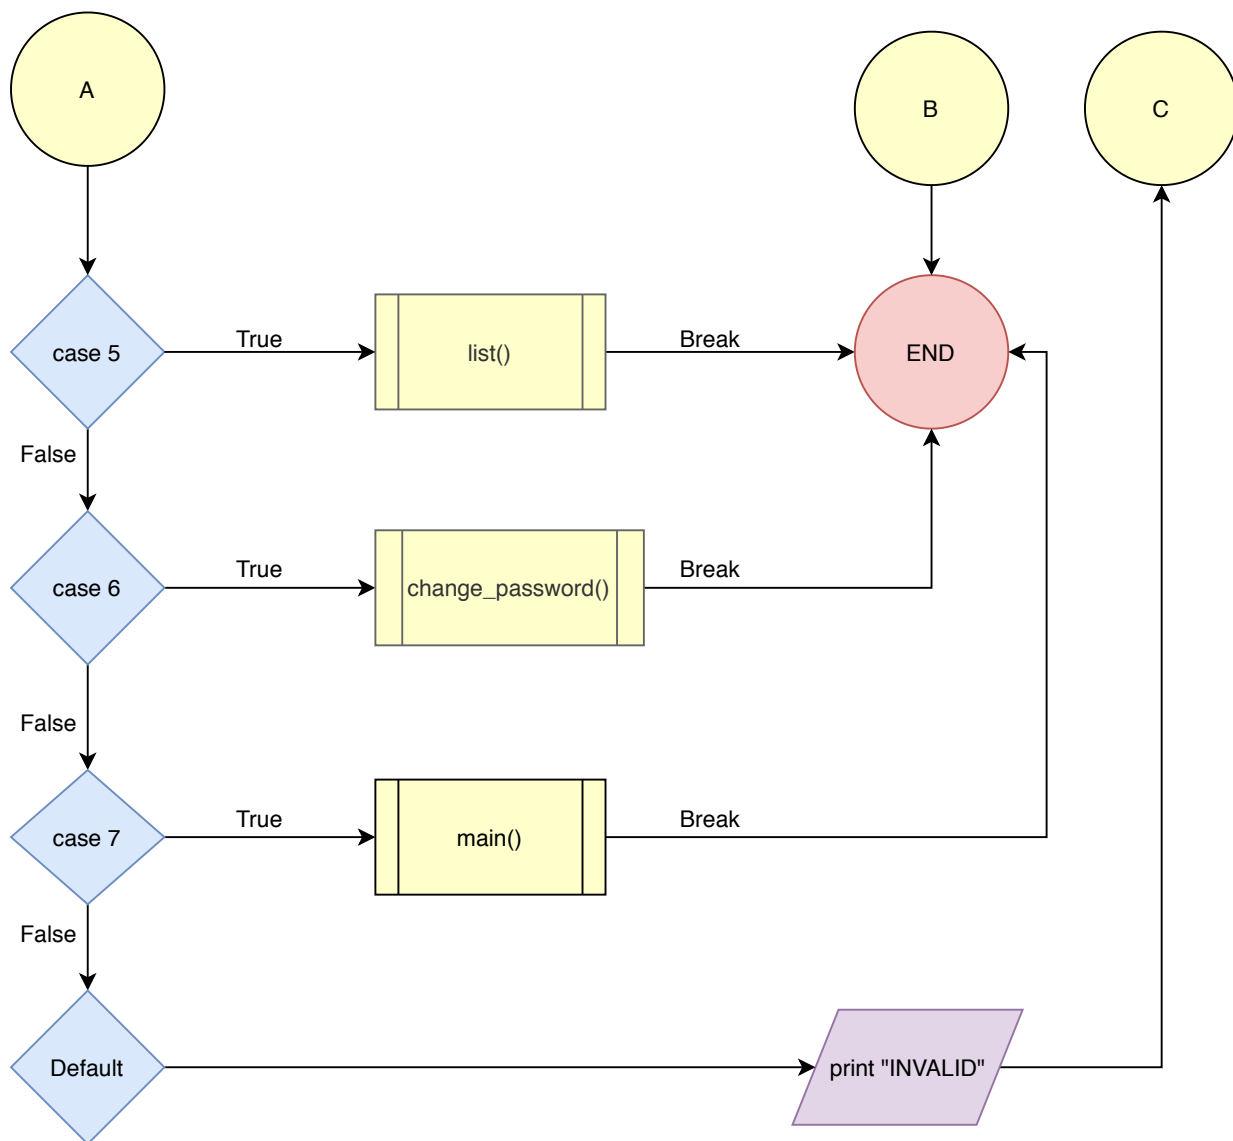

This function lets the employer login if he or she is registered.

# post\_login()

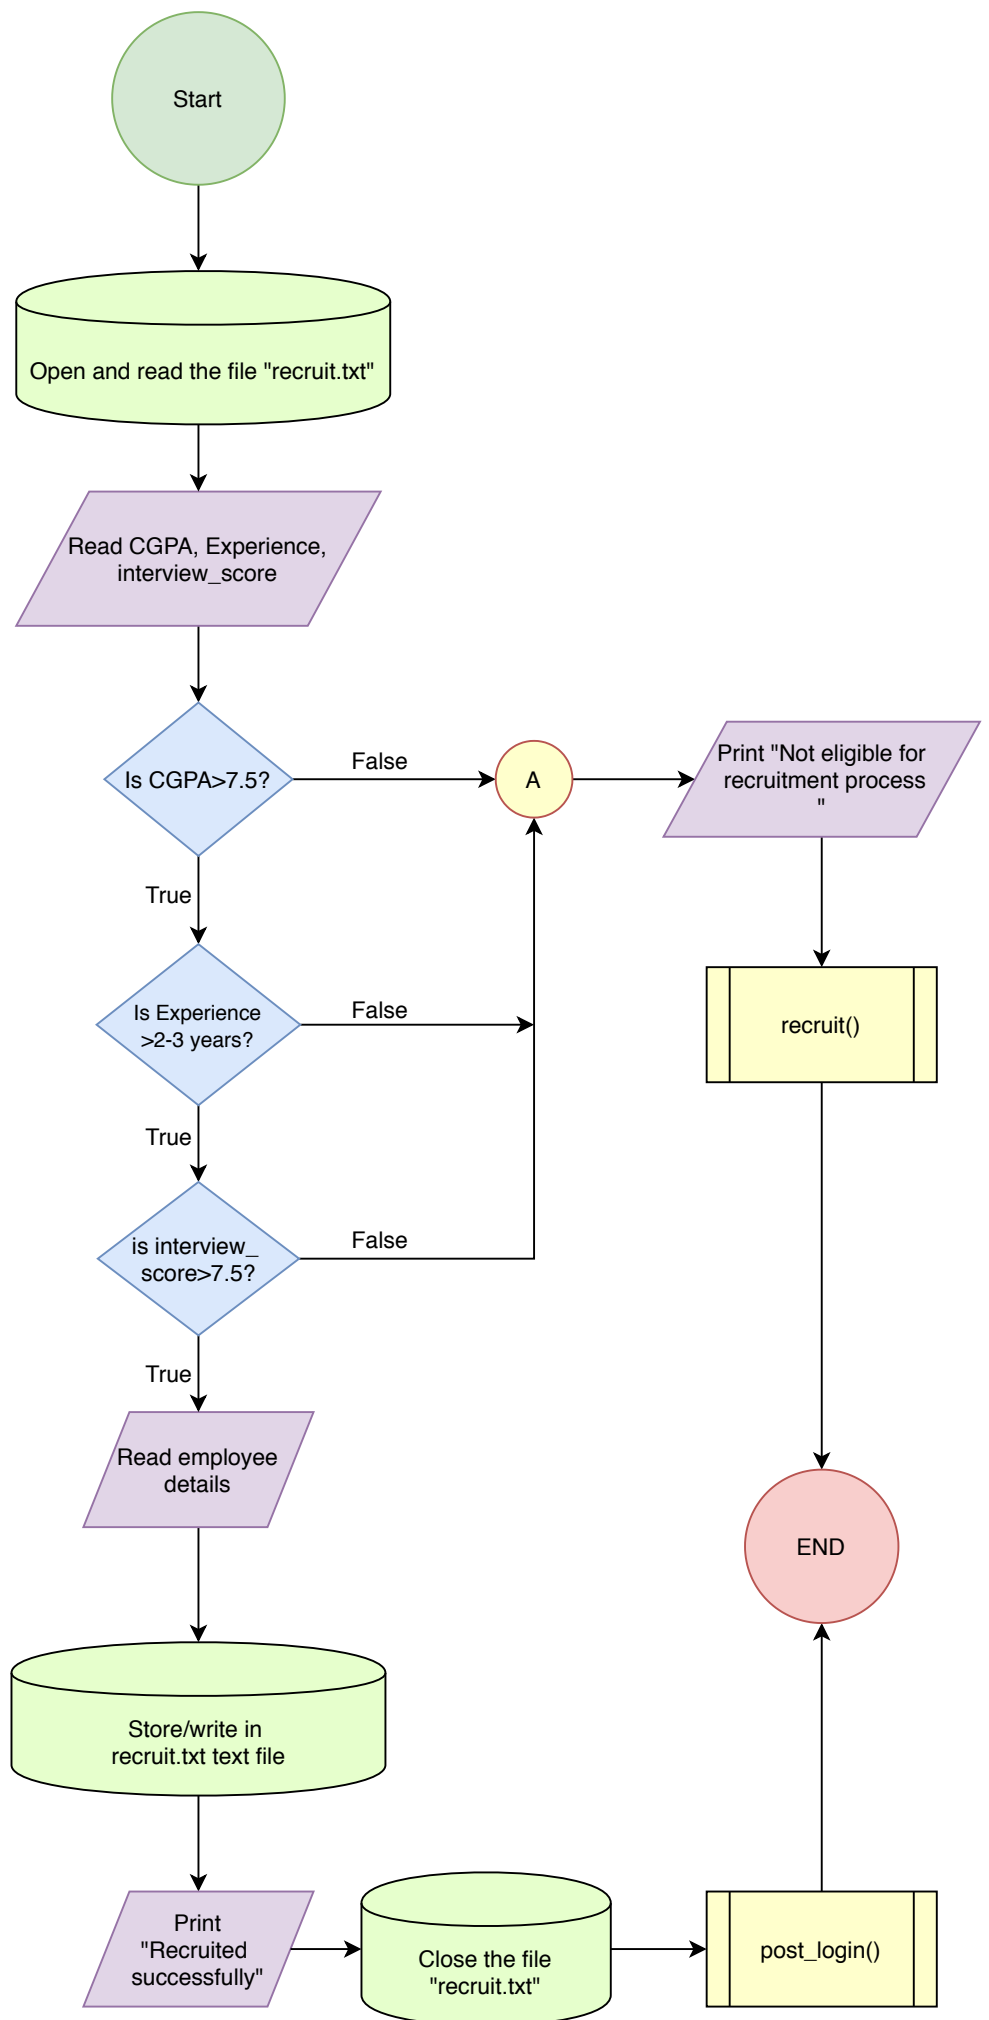

After login this function is an menu driven function to let the employer do various operations regarding employee management

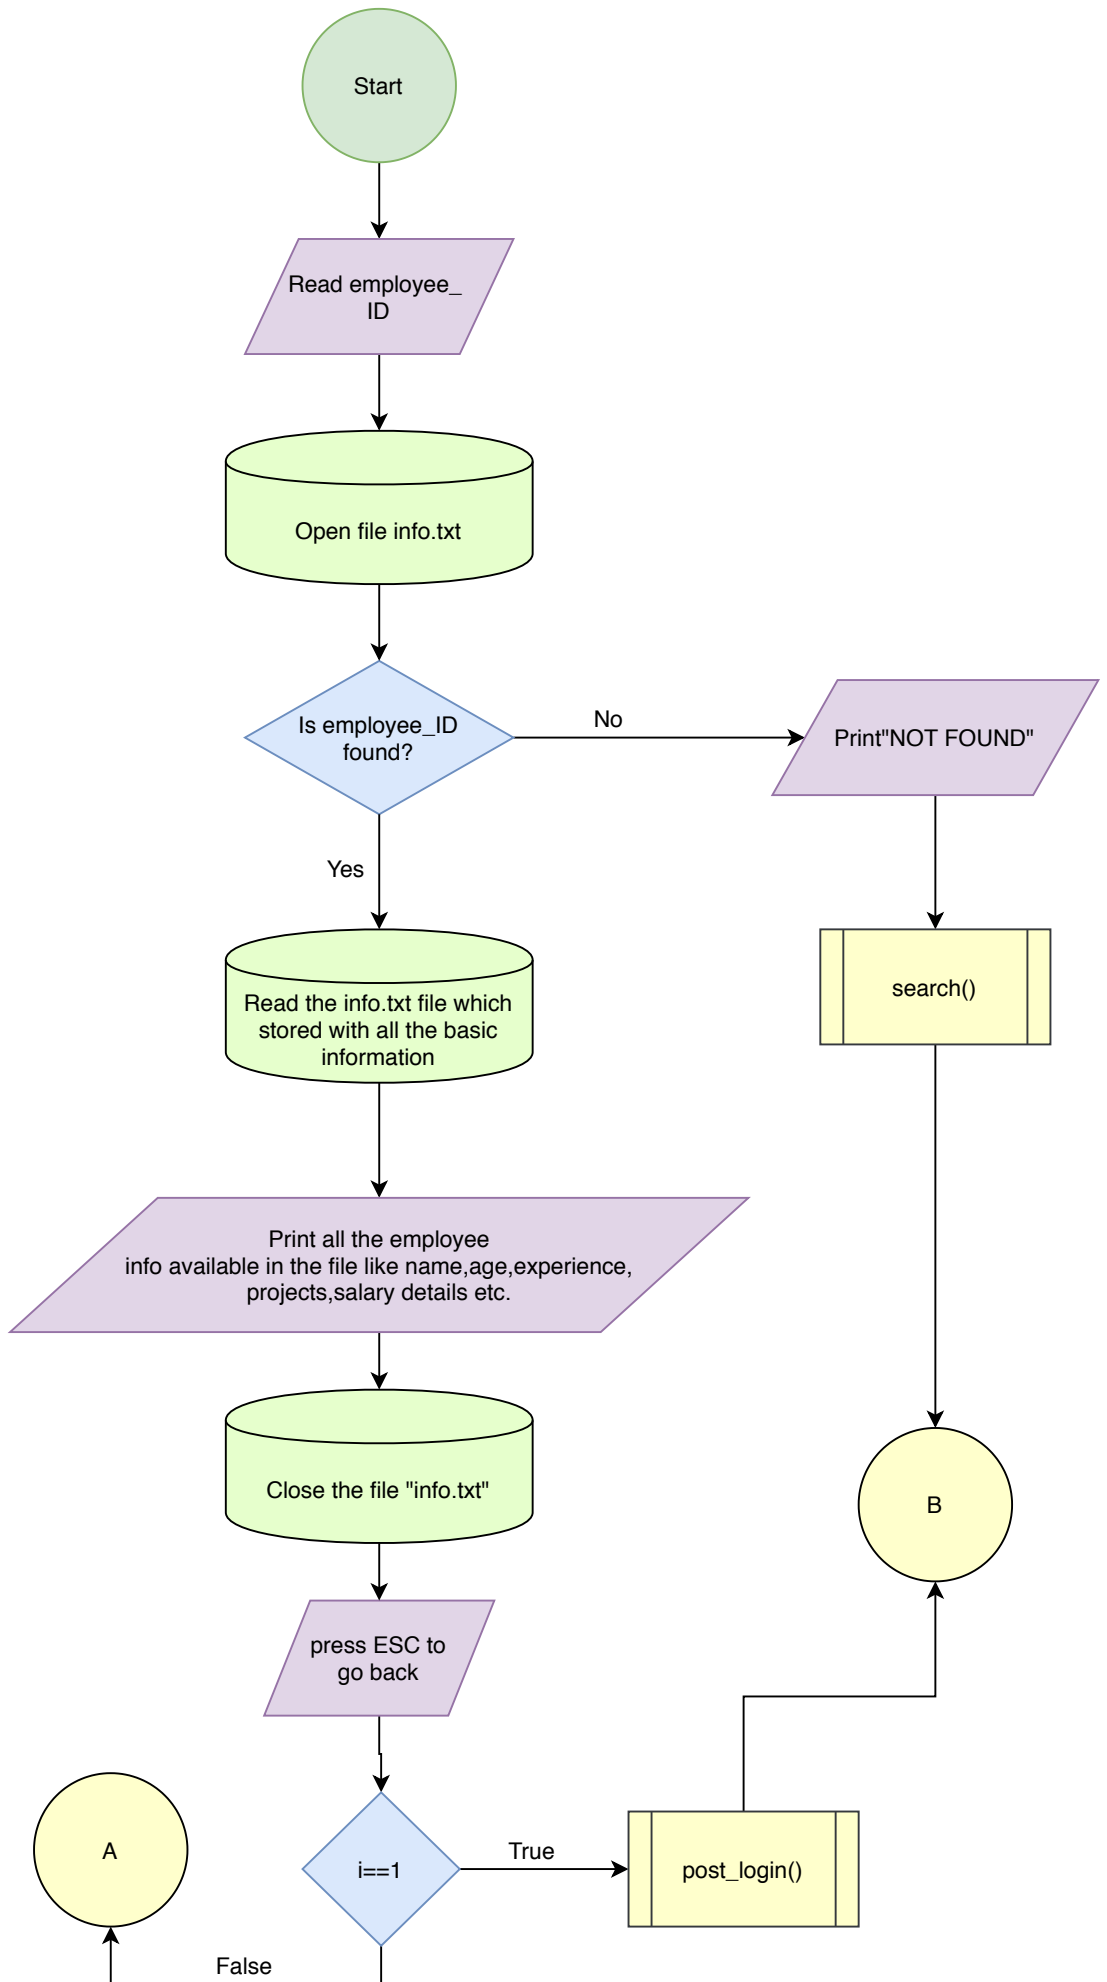

# recruit()

The recruitment process is explained here. It is based on a certain criteria.

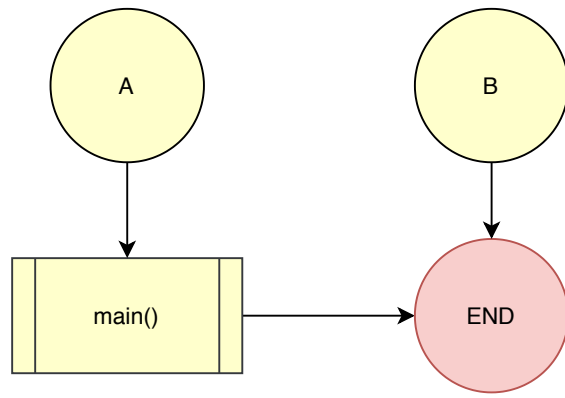

## search(int i)

This is a common function for both employee and employer. It searches the basic details of a particular ID.

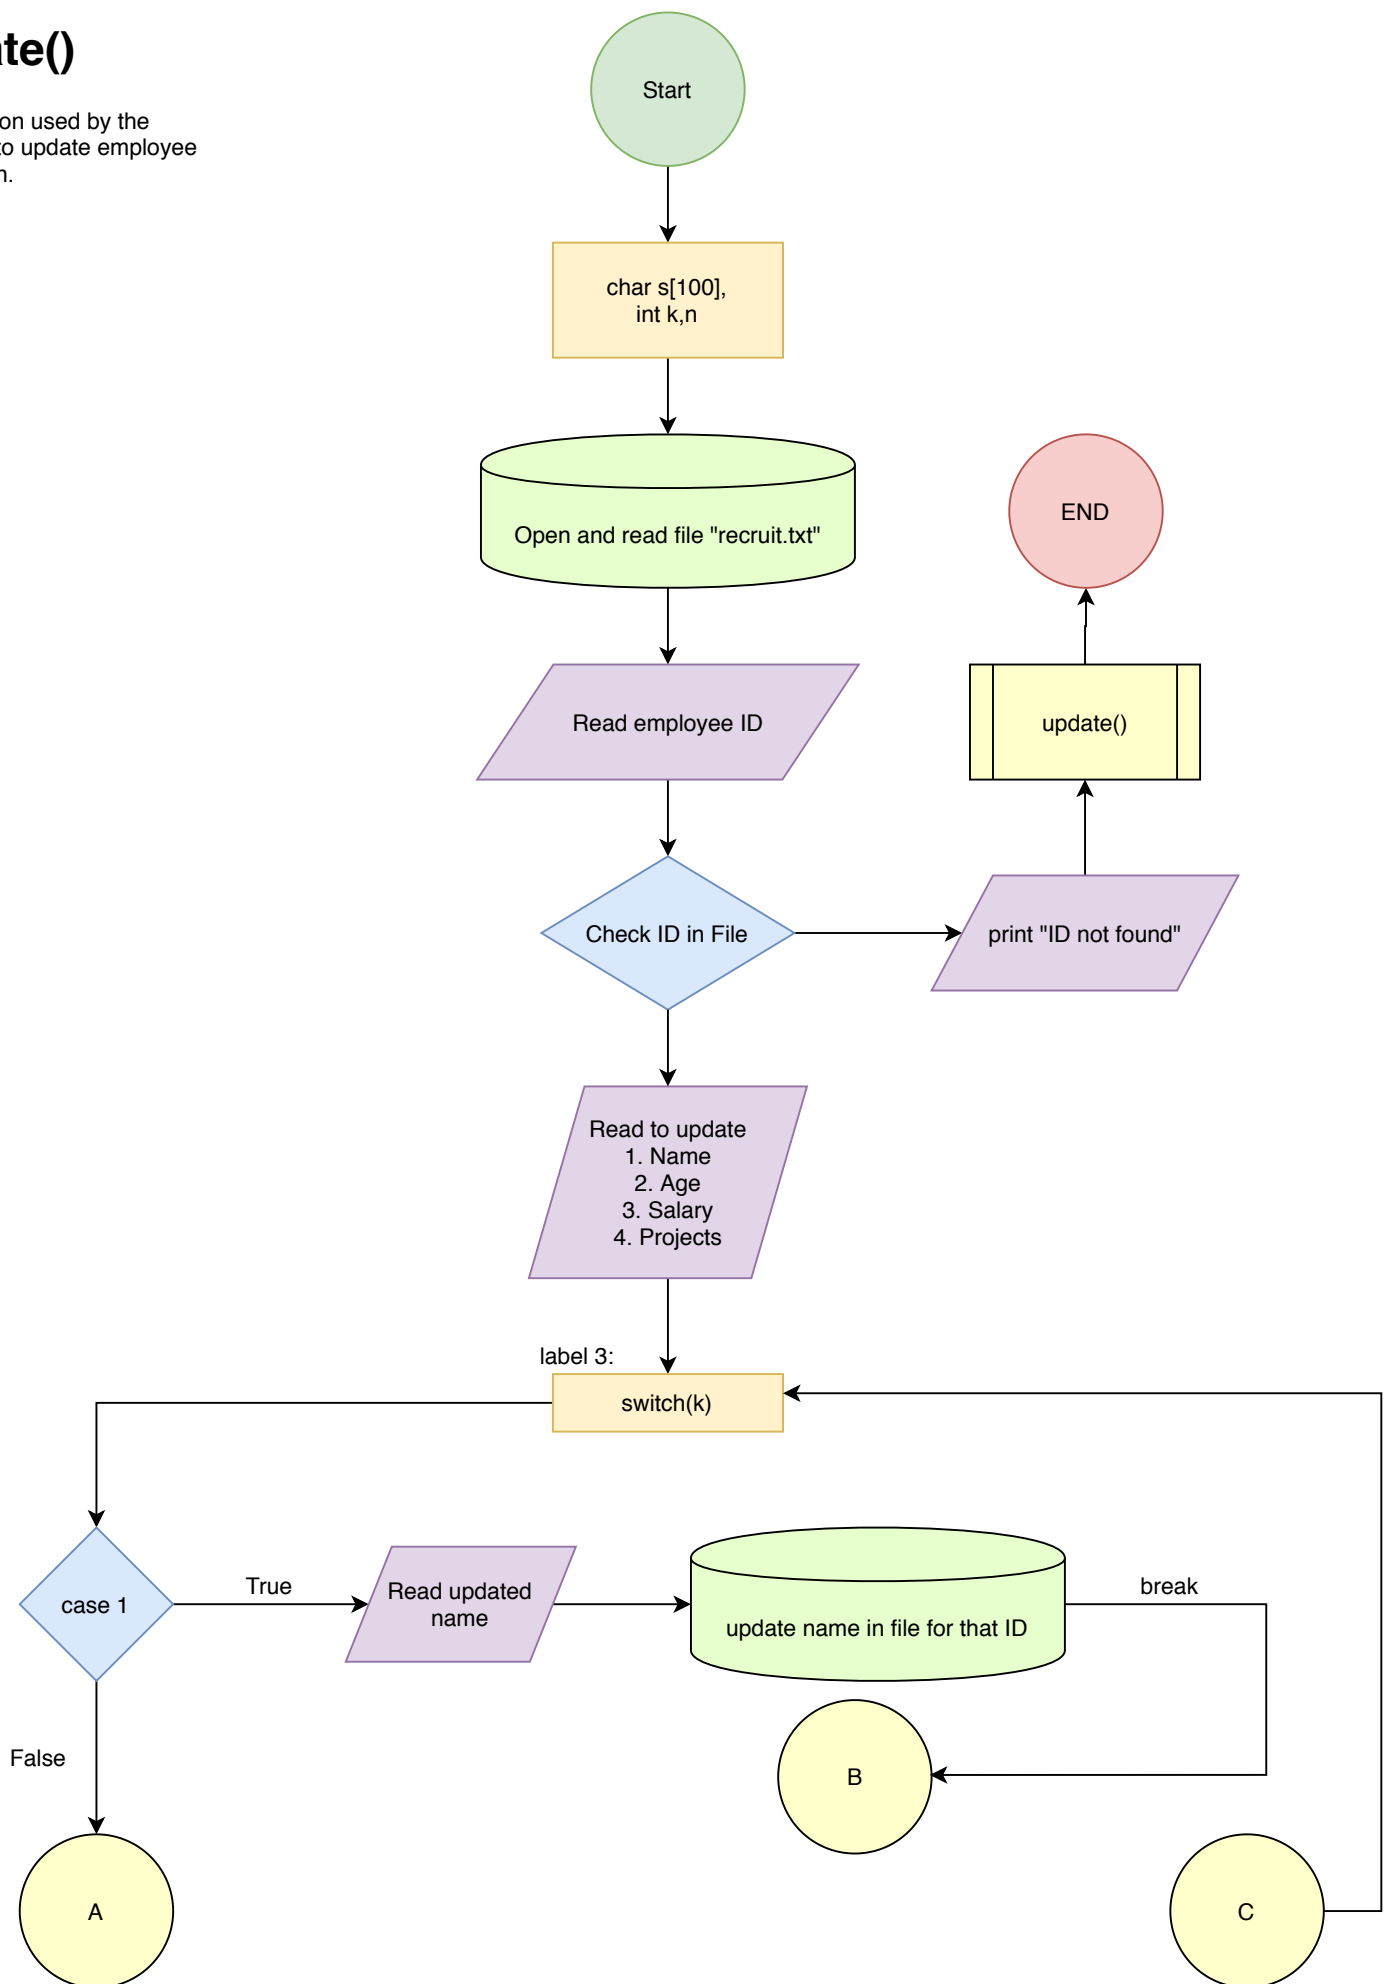

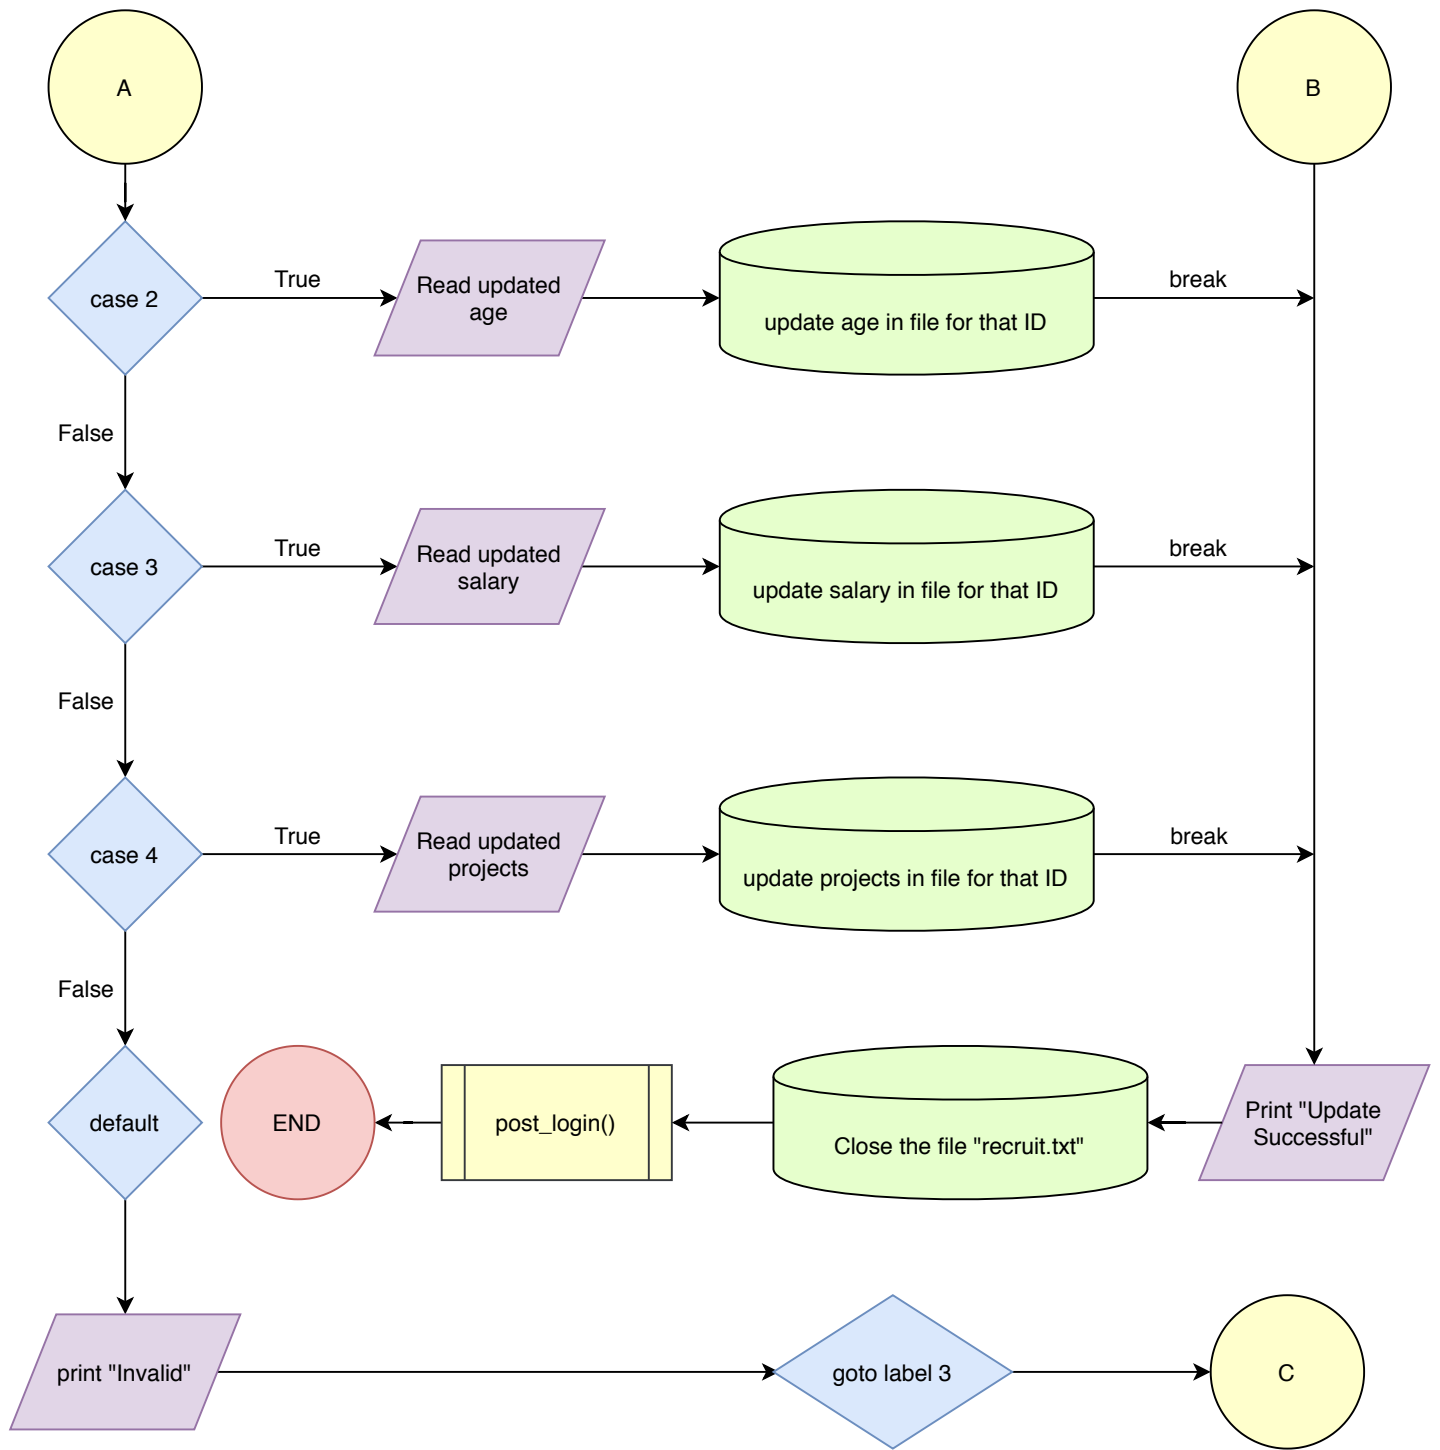

# update()

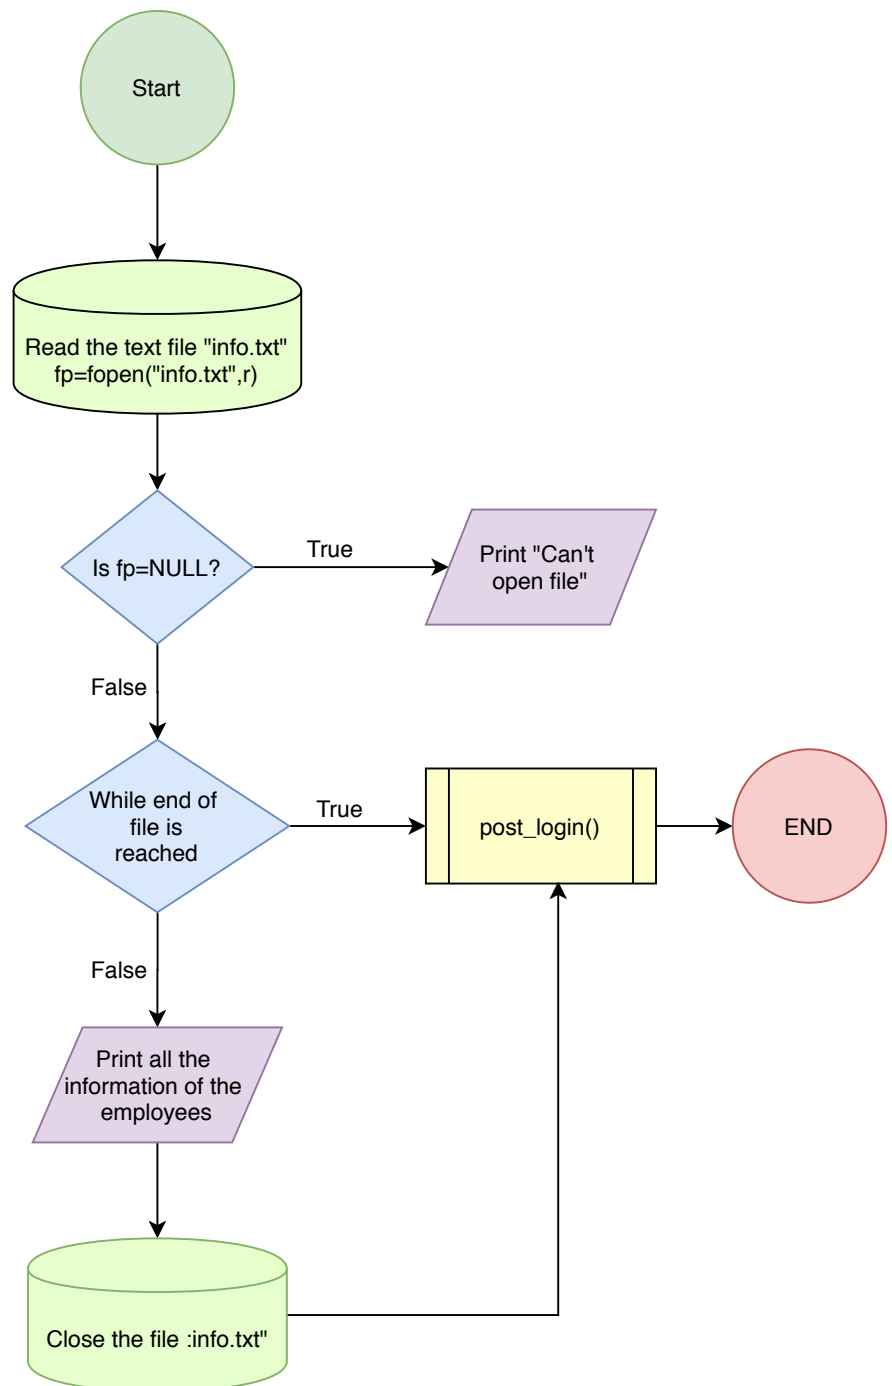

This function used by the employer to update employee information.

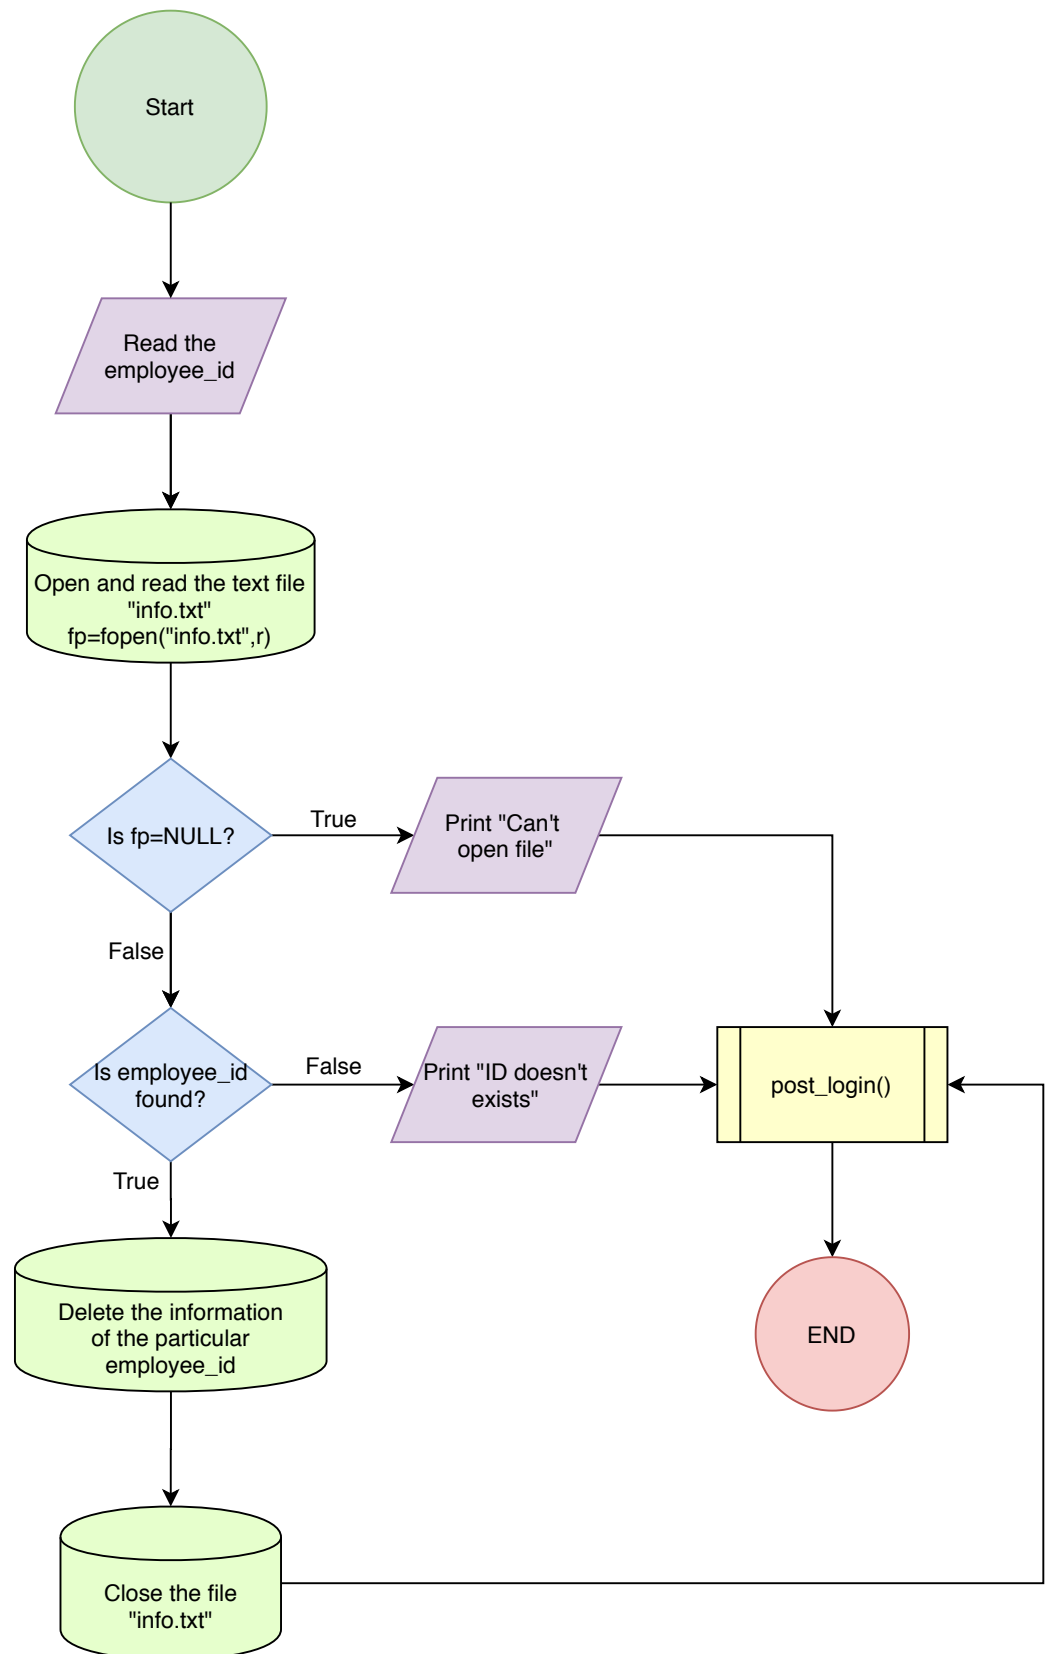

# list()

This function is used by the employer to see the basic details of all employees at once.

## delete()

This function is used by the employer to delete data of an employee.

# change\_password()

This function lets the employer change his password
